Game Of Life

The Game of Life, also known simply as Life, is a cellular automaton devised by the British mathematician John Horton Conway in 1970. Basically, this game consists of classes. However, each class has functions inside itself, which make game alive. Rules for the alive cells:

- Cells with less than 2 alive neighbours die
- Cells with more than 3 alive neighbours die
- Cells with 2 or 3 alive neighbours stay alive

Rules for the dead cells:

• Cells 3 alive neighbours reborn and become alive

OUTPUT:

Thats is what it is going to be like. However, you might have something completely different and it updates with the time
